

## **Rehabilitation Hospital of Indiana Indianapolis, Indiana**

The new Rehabilitation Hospital of Indiana clearly indicates its commitment to rehabilitation health care with this facility providing over 110,000 square feet of area devoted to the many uses of rehabilitation.

This facility has two large patient care wings and areas for both administrative and staff offices. Additionally, state-of-the-art physical therapy, hydrotherapy and occupational therapy facilities are very important parts of this facility.

The exterior trellis and the clearstory entrance provide a warm welcome for patients and visitors alike. The circular center court area also features clearstory construction. The gymnasium and pool are the center of the therapy facilities.

Structural steel was selected for this challenging project. Moment-resistant steel frames were used to resist the code-prescribed lateral loads and to limit the lateral drift.

The trellis and clearstory areas required special detailing, including tube steel trusses and round columns, to enable the structure to support all required loads while providing the final required appearance.
