

Juniata College von Liebig Center for Science Huntingdon, Pennsylvania

Building Square Footage: 88,000 sf
Project Completion: September 2002

The project consists of classroom and research space for biology and chemistry. The building will house laboratories for cell and tissue culture, atomic and magnetic resonance spectroscopy, and chromatography, as well as a biological separations room.

The building includes an architecturally significant two story atrium space with a barrel vault ceiling, ornamental stair and balcony for campus gatherings.

The structural system consists of a composite slab on steel frame clad with brick and stone. Careful attention was given to designing and detailing the cladding backup system such that the cladding can accommodate anticipated building deflections.

The project documents were delivered on schedule and well under the anticipated budget.
